

All the above localities are south of the Little Heart River, but the same coal has been opened up in a number of places on the north side of the river, particularly in the south half of sec. 14, T. 137 N., R. 81 W., where the bed is at least three and a half feet thick. It is being mined at present in the NE. quarter, sec. 14, and the drift runs back several hundred feet from the face of the outcrop. The coal is brought out on cars running on wooden rails with strap iron nailed on them. The lignite bed is here 33 inches thick and one foot of overlying clay is removed to give more room for working. A prospect hole dug in sec. 12, shows 34 inches of coal.
