

So far as known, the uppermost coal beds of the Fort Union formation in Morton County are those present four or five miles north of Hebron, in the extreme northwestern corner of the county. These probably lie over 600 feet above the base of the formation, and are believed to occur well above those found near Glen Ullin and New Salem. A 7-foot coal bed is found in the northeastern corner of T. 140 N., R. 90 W., at an elevation of about 2,450 feet above sea level. This has been mined at their clay pit in section 2 by the Hebron Pressed and Fire Brick Com pany, and also by H. T. Wadeson at the North Star Mine in section 3. The Mining Sub-Station of the State University at Hebron plans to open a model mine on this 7-foot coal seam in sec. 3, T. 140 N., R. 90 W.
